Push Lock Breech Plug (K4350PL)

- The new plug style features a push lock fitting to connect shock tube. The push lock fitting uses an internal grasping ring to form a tight seal around the tubing, just insert the tube into the fitting until it is seated. To release, simply push in on the release ring and pull the tube out of the fitting. This fitting replaces the insert, straight fitting, and ferrule nut of the original breech plug.
- The push lock breech plug uses a different firing pin and spring than the original breech. It can use the original pin and spring or any combination of the two, but the new pin and new spring cannot be used in the original breech.
- Fittings are available for Standard (1/8"), Military (4mm), and Mini shock tube
